Griffin Garland

New York, NY | griffingarland.com | LinkedIn

Technical Skills

Languages: C++, Python, C, SQL, Bash
Systems: Linux, gRPC, Protobuf, Kafka, RabbitMQ, Redis, Docker, Kubernetes, AWS, REST APIs
Tooling: Clang/LLVM, Static Analysis, CMake, Git, CI/CD
AI: AI Coding Agents (Claude Code, Codex), Agent Sandboxing

Experience

Bloomberg LP — *New York City, NY, USA*

Senior Software Engineer, Developer Experience — August 2026 – Present

- Cut round-trip latency by up to 225 ms for APAC and 75 ms for EMEA developers on Spaces, Bloomberg's containerized platform for developers and AI coding agents, by redesigning geo-affinity to run each user's VM and terminal server in a nearby data center (in beta).
- Built the regional path end to end: geo-DNS routing to region-local gRPC/Protobuf terminal servers, a new user-location detection method, and local proxies and mirrors in London, Frankfurt and Singapore.
- Contributing to a least-privilege sandbox that lets non-engineers safely use AI agents: allowlisted tools, MCP servers and URLs, plus container and OS-level controls (no shell, proxy-only network access).
- Improved reliability of Sidekick, a Claude-based service that turns prompts into PRs and fixes reviewer comments: fixed workspace-creation race conditions, surfaced launch failures, and extended review monitoring to the full PR lifetime.

Software Engineering Team Lead, Developer Experience — April 2024 – August 2026

- Led 6 engineers plus 2 contractors owning Bloomberg's static analysis platform, a Kafka-based distributed pipeline running 2.5M+ jobs per week across tens of thousands of repos; wrote design docs, stayed about 50% hands-on, and championed AI agents on the team.
- Drove the move to running analysis tools in containers, improving reliability, debuggability and the experience for tool authors.
- Integrated static analysis into the company build system and CI, giving every repository one interface across all supported languages.
- Maintained Clang LibTooling, clang-tidy and clang-query integrations; reviewed C++ checks contributed by infrastructure teams.
- Expanded coverage to all 6 tier-one and tier-two languages and, with the CISO's office, 500+ vulnerability checks (SQL injection, memory safety), meeting EU DORA and SSDF requirements.
- Designed a multi-agent development workflow (architect, implementer, test, reviewer and compatibility-checker agents under a lead agent) that turns a feature request into a phased design doc and tested code with cross-model review (Claude Code, Codex); also used agents with MCP log search to triage production issues and measure how often failures occur.

Software Engineering Team Lead, Trading Solutions — May 2022 – March 2024

- Led 5 engineers on Bloomberg's buy-side order management system, co-owning its C++ order and trade entry engine, which processes up to hundreds of millions of transactions daily.
- Delivered bond forward and loan support across multiple C++ services, required to onboard institutional clients: reference data validation, schema changes, and ORM and persistence work in a downstream transaction service; built key parts myself.

Senior Software Engineer, Trading Solutions — October 2017 – May 2022

- Built a Redis-backed distributed cache for a settings service: 5x faster page loads, 50x lower latency on cached requests, 99%+ hit rate.
- Replaced a producer-coupled, database-backed queue with a general RabbitMQ messaging layer for the C++ trade engine's batch APIs.
- Tech lead for integrating Bloomberg's basket-trading product with its order management system, eliminating manual re-entry of orders.
- Ported 21 core C++ services and libraries from Solaris/AIX to Linux; technical leader in the department's Linux migration working group.

Solace Corporation — *Kanata, ON, Canada*

Cloud Integration Software Engineer — April 2017 – August 2017

- Implemented LDAP authentication in Java for the Solace Cloud Foundry tile; automated AWS test environments with CloudFormation.

Software Developer — June 2015 – March 2017

- Maintained and extended the C++ configuration management software for the Solace Messaging Appliance.
- Designed and implemented a RESTful configuration API in Python; redesigned its generated command handling around polymorphism.

Education

University of Toronto — September 2010 – June 2015

Bachelor of Applied Science, Electrical and Computer Engineering — *Toronto, ON, Canada*

- 16-month co-op between 3rd and 4th year at Algorithmics (an IBM company).
